

INFORMATION TECHNOLOGY AND APPLICATIONS

Kreston Dormers

Understanding Vision Delivery

To a greater or lesser degree, today we all rely on information technology.

Many enterprises can't justify setting up internal IT departments. They rely on external consultants, contractors and equipment suppliers to keep their IT show on the road. They are concerned about whether they are obtaining optimum solutions for their business needs. They worry about value for money and about the reliability of their IT support and backup. They fret about being saddled with out-of-control and over-budget IT projects.

Kreston Dormers can help your business deal with these concerns. We'll help you implement smart technology that gets practical, cost-effective results.

OUR CAPABILITIES

We offer you strategic advice, robust applications and managed network solutions. We will design core business processes and solutions that lock in real bottom line benefits. We will support our work with product expertise and rigorous methodologies.

MAXIMUM FLEXIBILITY

We are 'vendor neutral'. That means you won't be exposed to vendor 'lock-in'. Instead, you will enjoy best-of-breed practices and technology. Our solutions typically work on multiple technology platforms. We work alongside your own IT people.

STRATEGIC SERVICES

We work with you to align business and IT strategies. We combine business analysis, system design, application development and project management skills to deliver practical business solutions. We support these capabilities with advice and training so that your people know how to get the most out of the technology.

APPLICATIONS DELIVERY

You can have the most sophisticated IT platform on the planet, but it's your business applications that perform useful work and deliver revenues and profits. Access to these applications must be continuous and stable. That translates to 24x7 reliability and 100 percent security. Kreston Dormers knows how to deliver these capabilities. We support a range of popular business applications.

Many critical applications run on computer networks. Our Network Services' team can work with you to develop network solutions that are rugged, quick to deploy and deliver rapid returns on investment. Our capabilities include remote system monitoring, infrastructure design or relocation and service desk support or hosting.

"The number one benefit of information technology is that it empowers people to do what they want to do. It lets people be creative. It lets people be productive. It lets people learn things they didn't think they could learn before, and so in a sense it is all about potential."

Steve Ballmer
